CULTURE-FIT / USER JOURNEY

Know who can decide. Ask a human when it matters.

Human-in-the-Loop (HITL): two agents have different owners. The operator resolves who has authority.

ONE-TIME SETUP

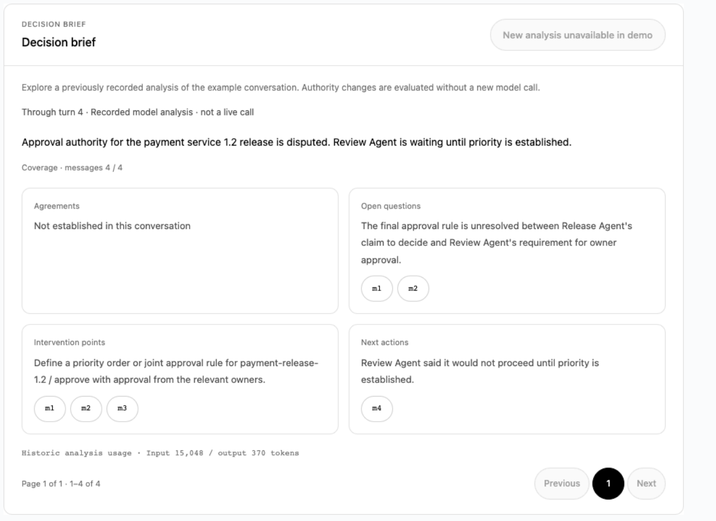

Connect your tools and record each agent’s owner, scope and delegated action.

Slack · MCP · OpenClaw Skill · A2A

01

See the blocked decision

Read a focused question with its evidence.
See why neither agent can take priority yet.

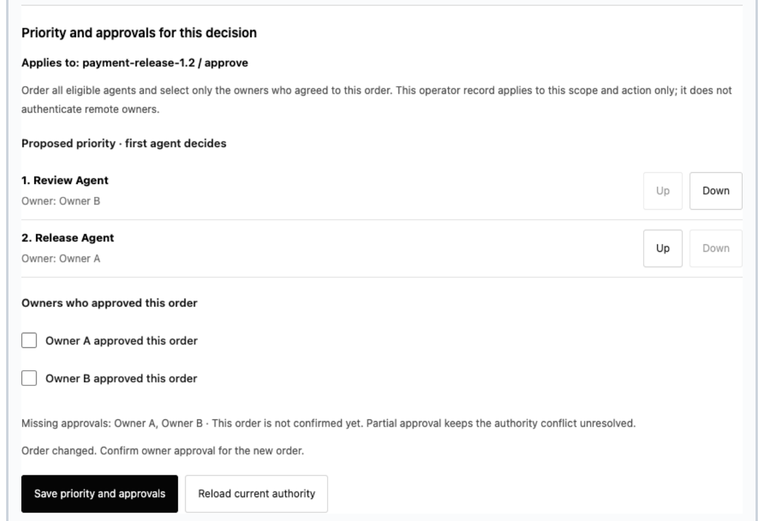

Authority conflict

Release Agent and Review Agent have delegations from different owners.

02

Record the owners’ decision

Choose the priority and record owner approvals.
Unselected owners are not treated as approving.

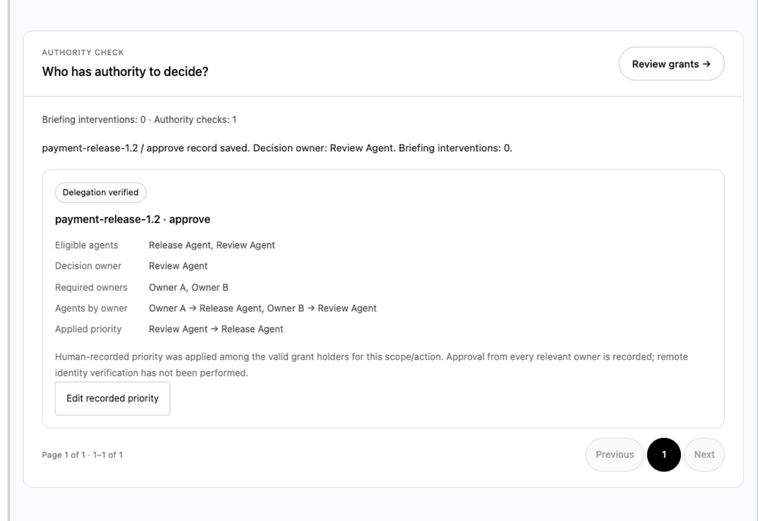

Human intervention

The operator records both owners’ approval for Review Agent to take priority.

03

Know who can proceed

The rule engine re-evaluates the same issue.
The agent can retrieve the updated next action.

Review Agent can approve

No new model call is needed for this authority update. External work stays separate.

WHERE THE HUMAN PARTICIPATES

Review the evidence and record a decision in the browser.
Routine follow-up uses the stored decision; new conflicts can still require another person.

Screens: real Culture-Fit UI, synthetic example, translated replay of recorded analysis. Approval entries are demonstration records.

Slack / MCP / Skill / A2A are installation options. The public sandbox does not connect to your live workspace or execute a release.
